"Identification of a new family of human epithelial protein kinases containing two leucine/isoleucine-zipper domains.";
Eur. J. Biochem. 213:701-710(1993).
-!- CATALYTIC ACTIVITY: ATP + a protein = ADP + a phosphoprotein.
-!- TISSUE SPECIFICITY: EXPRESSED IN BRAIN AND SKELETAL MUSCLE.
-!- SIMILARITY: BELONGS TO THE SER/THR FAMILY OF PROTEIN KINASES.
MAP KINASE KINASE KINASE SUBPAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                M3KA HUMAN STANDARD; PRT; 954 AA. 002779; Q12761; Q14871; Q1-128, Created) 30-MAY-2000 (Rel. 39, Last sequence update) 15-JUN-2002 (Rel. 41, Last annotation update) Mitogen-activated protein kinase kinase (Mixed lineage kinase 2) (Protein kinase MST). "Characterization of dual leucine zipper-bearing kinase, a mixed lineage kinase present in synaptic terminals whose phosphorylation state is regulated by membrane depolarization via calcineurin.";
J. Biol. Chem. 271:16888-16896(1996).
--- FUNCTION: May be an activator of the JNK/SAPK pathway.
Phosphorylates beta-casein, histone 1 and myelin basic protein in
                                                                                                                                                                                                                                               -!- COFACTOR: Magnesium.
-!- SUBCELLULAR LOCATION: Cytoplasmic and membrane-associated.
-!- TISSUE SPECIFICITY: Expressed in brain, kidney, lung, heart, testis, gastrointestinal tract, stomach, liver and pancreas. Within the nervous system, predominantly expressed in neurons and enriched in synaptic terminals.
